ERG’s CEO Shukhrat Ibragimov outlines growth path for ERG Service

Shukhrat Ibragimov, CEO and Chairman of the Board of Directors of Eurasian Resources Group (ERG), the global metals and mining company headquartered in Luxembourg, emphasised the significant growth potential and strategic importance of subsidiary ERG Service during a planned visit to the Group’s operations in Kazakhstan. ERG Service marks its 10-year anniversary in 2025.

The in-house engineering arm provides specialised support to the Group’s mining, metals and energy divisions. Its core activities include repairing energy, mining, transport and technological equipment, manufacturing engineering products, and operating foundry and rolling production.

This guarantees high operational self-sufficiency for ERG’s Kazakhstan operations.

« It is the right moment for ERG Service to leverage its competitive advantages and reinforce our position, » said Shukhrat Ibragimov. « Having established strong internal supply chains, we now plan to extend our portfolio of high-quality products and services to the markets and at a greater scale. »

In 2025, ERG Service will start producing hammer mills at the Pavlodar Machinery Plant, supplying ERG’s Aksu Power Plant for coal grinding.

In addition, ERG Service’s Repair and Mechanical Metal Rolling Plant will upgrade its ball-rolling mill, doubling productivity and, for the first time, allow the manufacture of 60 mm grinding balls.

These strategic machine-tool upgrades will expand ERG Service’s capacity for upcoming projects and on-site repairs. A new laser-cutting machine, already operational, has boosted sheet- and profile-cutting productivity by 60 per cent, reducing the production time for energy components such as beater arms from 57 minutes to just four.

ERG Service has also installed a high-speed CNC gantry drilling machine, which is set to triple its annual production of tube plates.
